

C2 - Data Analysis

C-DAT-200

Data exploratory

of an grocery-delivery website

1.0

Data exploratory

delivery method: dataviz on Github
language: python

Let's try your data manipulation skills on a real-world dataset.

This anonymized dataset contains over **3 million orders** and **200k users** from a grocery-delivery website

DATASET

Each users have **from 4 to 100 orders**, with the sequence of products purchased in each order.

There is also the week and hour of day the order was placed and a relative measure of time between orders.

A **product** are inside **aisles** which themselves are splitted into **categories**.

A **Green Banana** would be in the **fresh fruits** aisle which itself is part of the **produce** category.

PROJECT GOAL

You are free to decide what analysis and charts you want to submit.

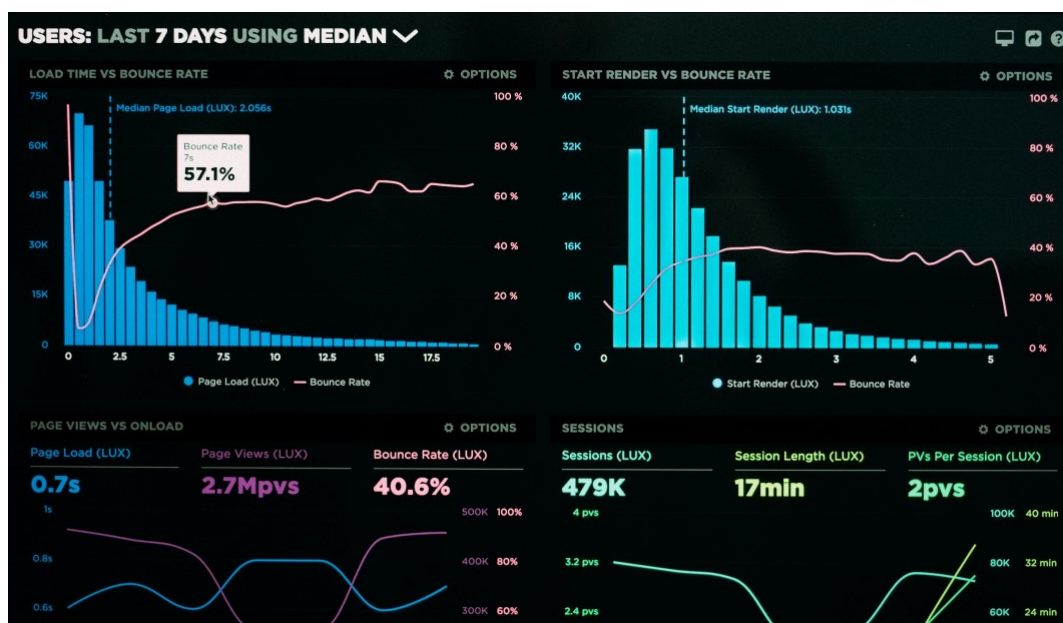

During the oral examination next week you have to explain thoroughly your choices.

Your work must be as organized and professional as possible.

GETTING STARTED

These are **examples** of what you could do.

- When do people order ?
- How many items do people buy ?
- What items sell the most ?
- How often do people order the same items again ?
- Which item do people put into the cart first ?
- What is the ratio of orders containing organic vs not organic ?
- How many unique products are offered in each department/aisle ?
- Is there an association between time of last order and probability of reorder ?

GOING FURTHER

This is the perfect time if you want to try professional Data Visualization tools such as **Microsoft PowerBI** or **Salesforce Tableau Software**

You have free license for both with your Epitech account.

There are also several python libraries worth the try

- **Bokeh** : <https://bokeh.org/>
- **Plotly** : <https://plotly.com/>
- **Pandas + D3.js** : <https://d3js.org/>
